

Class STUDY-EXPERIMENTAL CONCEPT: STAKEHOLDER VIEWS

Systems of Interest:
Render Stakeholder View

Render Stakeholder View

Trigger
New digital study design information is approved. (Note: this could be prior to an approved study protocol.)

Primary Scenario
A User selects a study and study version to extract from a USDM-compliant Information Stream. The System extracts the study information and identifies the User's archetype to use in generating the relevant view perspective they are interested in. A corresponding view of the digital study design information is rendered. Additionally, the User may compare design information across study arms of the same study or across different studies to contrast differences between the arms/studies.

Result
The given stakeholder has a study design rendered in the appropriate format.
